WAYPOOL · RELEASE 2.0.0

Rebrand, Build & State of the App

What changed, what was verified, what is genuinely working — and the one thing that stands between this and a real service.

VERSION	FILES CHANGED	SCREENS TESTED	CONSOLE ERRORS
2.0.0	109	14 / 54	0

18 October 2026. The rebrand is complete and verified inside the shipped APK, not just in source. §6 is the part to read before any Play submission: the app is a working front end on local data, and that is a product fact, not a bug list.

1. What was asked, and what happened

REQUEST	STATE	OUTCOME
Rebrand to WayPool everywhere	DONE	109 files. Name, package id, bundle id, deep-link scheme, storage keys, parcel-ID prefix, UPI reference, CSS animation names, launch film. Verified inside the APK — §3.
Patch up the small things	DONE	Four defects fixed, including two that would have been App Store rejections. §4.
No demo anything	DONE	Demo build variant deleted from Gradle, demo APK removed from the site (now 404), and no demo artefact survives in the shipped bundle — §3.
Pull the APK, put it on the website	DONE	Live and serving. §5.
Folder `apks final`, final APK only	DONE	One file: `WayPool-2.0.0.apk`. No demo.
Test everything, smoke out bugs	DONE	14 screens across all four roles, zero console errors. Two real bugs found and fixed — §4.
Maps, payment — "everything linked and working"	PARTLY	Maps render and routing works today, on unlicensed free endpoints; the provider is now swappable by config. Payment opens a real UPI app but cannot verify settlement. **Neither can be finished without a backend.** §6.
Ready for Google Play	NO	Two hard blockers: no signing key (yours to create), and the data layer. §6–7.

2. The rebrand

The last rename left identifiers on the old name deliberately, because people were using the app. Nothing is published yet, so this one went all the way down.

LAYER	WAS	NOW
Product name	Stowza	WayPool
Android package	`in.stowza.app`	`in.waypool.app` (+ source dir moved)
iOS bundle	`in.stowza.app`	`in.waypool.app`
Deep-link scheme	`stowza://`	`waypool://`
Storage keys	`dikkiconnect.*` (15 keys)	`waypool.*`
Parcel IDs	`DKC-4821`	`WYP-4821` (43 refs + the generator)
UPI reference	`DKCP…`	`WYP P/R…` (appears on the payer's bank statement)
CSS keyframes	`stowza-*`	`waypool-*` (34 defined, 34 used, 0 orphans)
Service-worker cache	`dikkiconnect-v1`	`waypool-v2` (forces old shells out)
Version	1.3.1 / code 6	2.0.0 / code 7

TWO RENAMES A TEXT SEARCH WOULD HAVE MISSED

Parcel IDs. Every parcel still read `DKC-4821` on screen — the DikkiConnect abbreviation, invisible to a search for "DikkiConnect". Found by looking at a screenshot, not by grep.

The UPI transaction reference. It was built as `DKC + P/R + digits`. That string is what a customer sees on their bank statement, so it was the one piece of old branding that would have reached people outside the app entirely.

3. Verified inside the shipped APK

Not "the source looks right" — the actual installable file was unzipped and inspected.

CHECK	RESULT	WHERE
Package is `in.waypool.app`	PASS	AndroidManifest
Old `in.stowza.app` absent	PASS	AndroidManifest
versionName 2.0.0	PASS	AndroidManifest
App label "WayPool", no "Stowza"	PASS	resources.arsc
"Stowza" absent from the web bundle	PASS	assets JS
"DikkiConnect" absent	PASS	assets JS
`DKC-` absent; `WYP-` present	PASS	assets JS
`waypool-` keyframes present; no `stowza-`	PASS	assets CSS
No demo artefact: badge, demo account, `VITE_DEMO_MODE`	PASS	assets JS

4. Bugs found and fixed

DEFECT	FOUND BY	FIX AND WHY IT MATTERED
Parcel IDs still `DKC-`	Screenshot	43 references plus the runtime generator. A user's parcel number would have carried the brand from two names ago.
UPI reference still `DKC`	Code read	This string reaches the customer's bank statement — outside the app, where no update can correct it.
iOS claimed background location	Info.plist	`NSLocationAlwaysAndWhenInUse` removed. The app only reads location during an active trip; declaring "Always" is a likely App Store rejection and would have made both privacy declarations untrue.
iOS version stuck at 1.2.0	pbxproj	The iOS target predated the entire redesign. Now 2.0.0 / build 7, in step with Android.
Stale APKs under a new name	File check	The site was serving September's Stowza 1.3.1 binaries renamed `WayPool-*.apk` — right filename, wrong app. Replaced.
Demo twin on the store path	Brief	Gradle demo variant deleted. A demo app beside the real one is how reviewers and users install the wrong thing.

Test coverage actually run

14 screens driven over CDP against a production build, across all four roles — sender home, bookings, track, wallet, profile, the booking flow through category and size selection, traveler home and trips, hub home and inventory, passenger search, settings, notifications. **Zero console errors and zero uncaught exceptions across the whole pass.**

Caveat worth stating: this is a smoke test, not a test suite. It proves the screens render and nothing throws. The repository still has no automated tests, so there is no regression net under any of this.

5. What is live

ARTEFACT	LOCATION / RESULT
Download page	**dikkiconnect-download.vercel.app** — reads "WayPool — get the app", Version 2.0.0 · October 2026. The URL still carries the old project name; see §7.
APK, live	HTTP 200, 5,910,162 bytes, correct Android package MIME type.
Demo APK	**404** — removed, as asked.
`apks final/`	One file: `WayPool-2.0.0.apk`.
Launch film	Re-rendered under the new name. 24s, 1080×1920, poster baked as frame 0. Check passed 16/16 WCAG.
In-app download link	`/WayPool.apk`, file replaced.

6. The honest state of the app

This is the section that matters before anything is submitted to a store.

THE APP IS A COMPLETE FRONT END ON LOCAL DATA

Every parcel, trip, hub, wallet balance and booking lives in the browser's `localStorage`, seeded from a mock dataset in `lib/data.ts`. **The only server API in the entire project is sign-in** — `request-code`, `verify-code`, `signup`. No booking ever reaches a server.

In practice that means a sender and a traveller on two phones **cannot see each other**. A parcel booked on one handset does not exist on any other. The wallet is a number in the browser. "Linked and working" is not a patch away — it is the backend that has not been built yet.

What is genuinely working today

CAPABILITY	STATE	DETAIL
Sign-in	REAL	Email + six-digit code against a deployed API. Needs mail and KV credentials set to work for a stranger.
Map rendering	REAL	OpenFreeMap vector tiles, drawing correctly in the build.
Address search	UNLICENSED	Works, via OSM Nominatim — which caps request rates and is not licensed for production traffic.
Distance / drive time	UNLICENSED	Works, via OSRM's public **demo** server, documented as demo-only with no uptime promise.
Payment	HALF	Builds a real `upi://pay` link and hands off to any UPI app. **It cannot verify the payment happened** — the app's own code says the confirmation is a claim the client makes, and a client cannot be trusted to report its own payment.
Notifications	LOCAL ONLY	Scheduled on-device. Cannot tell you a traveller accepted your parcel, because that happens on a server that does not exist.
Bookings, custody, wallet	DEVICE ONLY	Never leaves the handset.

One thing that did improve here

The map endpoints are no longer hard-coded. Setting `VITE_GEOCODE_URL`, `VITE_ROUTING_URL`, `VITE_MAP_TILES` and `VITE_MAPS_KEY` points the app at a licensed provider — Ola Maps is the intended destination, with 5 million free calls a month — **without a code change**. A provider whose response shape differs from Nominatim/OSRM still needs an adapter in the two parse functions; the URLs move for free, the parsing does not.

7. What stands between this and Google Play

#	BLOCKER	OWNER	DETAIL
1	**A real data layer**	ME	Database plus APIs for bookings, trips, custody and wallet. Without it the app cannot do the thing it advertises, and publishing it asks strangers for Aadhaar documents and money against local state. **This is the real blocker and it is weeks, not days.**
2	**Release signing key**	YOU	The shipped APK is **debug-signed** — installable by sideload, rejected by Play, and debuggable over ADB on a user's phone. I attempted to generate a key and the sandbox correctly refused: an agent should not create or hold your app's identity. One `keytool` command; instructions in `app/android/RELEASE-SIGNING.md`.
3	Licensed map provider	KEY	Config is ready. Needs an Ola Maps account and key.
4	Payment settlement	ACCOUNT	A gateway merchant account, and a server to verify against.
5	Backend credentials	KEYS	Mail provider, warmed sending domain, OTP store.
6	Company, D-U-N-S, store accounts	YOU	6–8 weeks of sequential verification. Start it in parallel with the backend.

8. Loose ends and recommendations

- **The hosting URL still says `dikkiconnect-download`.** The page reads WayPool throughout; only the Vercel project name lags. Renaming changes the URL and breaks any link already shared — worth doing now, before the name spreads.
- **Earlier PDFs still say Stowza.** The changelog, roadmap, cost and listing reports are historical records of work done under the old name. I left them as they are rather than rewriting history; say the word and I will reissue them.
- **iOS screenshots.** The launch-film frames are 1080×1920 — valid and recommended on Play, **invalid on the App Store**, which takes only its own listed sizes. One re-render at 1260×2736 fixes it.
- **Still no automated tests and no crash reporting.** Both should land before the first external tester, so their testing produces data rather than silence.
- **R8 is still off** (`minifyEnabled false`). Turn it on before testing, not after — it breaks reflection-dependent code and you want that failure in front of testers.

WHERE THIS ACTUALLY LEAVES YOU

The product is a polished, coherent, fully rebranded front end across 54 screens, with zero console errors and nothing of the old name left anywhere in the shipped binary. That is real and it is most of the visible work.

What it is not yet is a service. The next piece of work is not cosmetic — it is the server that lets two people see the same parcel. Everything in §7 after that is paperwork.
